Portfolio: lucasdeoliveira.vercel.app

lucasoliveirapimentel.dev@gmail.com
Barbacena, MG, Brazil

PROFESSIONAL OBJECTIVE

Full Stack Developer | Python

PROFESSIONAL SUMMARY

Full Stack Python student at EBAC and Computer Science undergraduate at UNIPAC Barbacena.

I build applications end to end, from data model to deployment. I have shipped a full stack personal library platform (FastAPI on Render, React + Vite on Vercel, PostgreSQL on Supabase) and a bilingual portfolio with a production contact pipeline, covering authentication, file uploads, external API integrations, Alembic migrations and OpenAPI documentation.

My most recent project, an investment portfolio API, is where my back-end decisions show most clearly: positions derived from transaction history instead of stored, per-user isolation with OAuth2 and JWT, cache-aside in Redis for the quotes API, and unit and integration tests. I work with async FastAPI and SQLAlchemy 2.0 on PostgreSQL, containerize with Docker Compose, and write code and documentation in English.

- Proficient in: Python, PyTest, Unittest, FastAPI, SQLAlchemy, PostgreSQL, REST APIs, Git, GitHub, Docker, Docker Compose, HTML5, CSS3, JavaScript, React and Vite.
- Working knowledge of: PyCharm, VS Code, Redis, Celery, OAuth2 and JWT, Render.
- Familiar with: MySQL, SQLite, Django, Django REST Framework.
- Methodologies: Scrum, Kanban.

EDUCATION

- B.Sc. in Computer Science – UNIPAC Barbacena (6th semester, expected graduation 2027) – Mar 2024 to Dec 2027.
- Full Stack Python – Professional Training Course – EBAC – May 2026 to Dec 2026.

LANGUAGES

- English: Advanced.
- Portuguese: Native.

PROFESSIONAL EXPERIENCE

Neogrid Informática LTDA (Lett Digital) | Remote

Oct 2021 - Jun 2026

(Large company – supply chain technology)

Data Quality Assistant (freelance from Oct 2021 to Nov 2022, full-time from Nov 2022)

- Reviewed about 1,000 SKUs daily across Nestlé, Ambev and PepsiCo catalogs, with **strong attention to detail at high volume** and a focus on data consistency and traceability.
- **Facilitated** the daily meetings of the Setup team (6 people), distributing the ClickUp backlog and negotiating task allocation to balance the workload.
- Resolved a critical incident in the Nestlé catalog (about 200 SKUs wrongly unmonitored), with **direct client communication** and coordination between Delivery and Customer Success until it was fixed the same day.
- **Documented and transferred knowledge** of business rules in Notion and Trello, reducing reliance on individual knowledge and speeding up onboarding of new members.
- **Autonomous remote work** with Scrum and Kanban, daily rituals and monthly results alignment with stakeholders.

RELEVANT PROJECTS (PERSONAL PROJECTS)

Personal Library – Full stack application (Personal Project)

Jul 2026

- Full stack application for managing a personal book collection, with a **REST API** in **Python** and **FastAPI** deployed on **Render**, front-end in **React + Vite** on Vercel and a **PostgreSQL** database on Supabase, covering the creation and consumption of web services end to end.
- System integration with the Google Books API and a manual entry fallback, plus file storage and handling with cover uploads via Supabase Storage.
- Class-to-table modeling and mapping with **SQLAlchemy** 2.0 on **PostgreSQL**, validation with Pydantic v2 schemas, versioned migrations with Alembic and automatic documentation via OpenAPI/Swagger.
- Endpoint access control and security with user authentication, pagination, reading status tracking and favorites.
- Repos: github.com/ilucasoliveira/personal-library-api · github.com/ilucasoliveira/personal-library-frontend

Portfolio + Contact API (Personal Project)

Jul 2026

- Bilingual portfolio with its own design system and a production contact pipeline: a **React + Vite** form, a **REST API** in **Python** and **FastAPI** for validation and integration with an external transactional email service (Resend).
- Scalable, maintainable layered architecture: after diagnosing blocked ports in production, the email layer was migrated from SMTP to a transactional service without changing routes or schemas.
- Precise HTTP semantics (201/422/503), CORS configuration and custom exceptions to decouple services.
- Live: lucasdeoliveira.vercel.app

Portfolio Tracker API – Investment portfolio (Personal Project)

Sep 2026

- **REST API** (async) in **Python** and **FastAPI** for tracking an investment portfolio, with business logic modeled around transactions: position and average price are derived from history at read time, keeping each operation as the source of truth.
- Endpoint access control and security with **OAuth2** password flow and **JWT**, passwords hashed with **argon2**, and per-user isolation enforced in every query, so a user can never access another user's data.
- Consumes an external quotes **API** with async httpx and an explicit timeout, with graceful degradation: if the provider is down, the portfolio still responds with its own data.
- Cache-aside in **Redis** per asset with TTL, so a ticker held in many portfolios is fetched from the external provider only once.
- Modeling with **SQLAlchemy** 2.0 async on **PostgreSQL** 18, using **NUMERIC** for monetary values, packaged with Docker Compose (**API**, **PostgreSQL** and **Redis**) with healthchecks and variables isolated in .env.
- Tests with **pytest**: unit tests for the position calculation rule and integration tests for the endpoints against a dedicated **PostgreSQL** instance.
- Repository: github.com/ilucasoliveira/portfolio-tracker-api

CORE COMPETENCIES

- Building and consuming web services | Validation with unit and integration tests | Background task execution | Performance and failure monitoring
- Back-end: Pydantic v2, Poetry, asynchronous programming (async/await), layered architecture, custom exception handling
- Front-end: responsive design, i18n (internationalization), API consumption
- Databases and cache: relational modeling, Alembic migrations, cache-aside with TTL and invalidation
- APIs and authentication: OpenAPI/Swagger, OAuth2 and JWT, password hashing with argon2, HTTP status semantics.
- Tools and deployment: Vercel, Supabase, Insomnia, environment variables, container healthchecks
- Collaboration: ClickUp, Notion, Trello, Excel

COURSES AND ADDITIONAL ACTIVITIES

- English – Fluency Academy Language School – completed in April 2026
